## HIAB Web Application Scanning

### Key Features:

- Scan thousands of web pages for vulnerabilities quickly and easily on ad-hoc or recurring basis.
- Highly accurate Cross Site Scripting and SQL Injection vulnerability detection.
- Support for scanning virtual hosted sites.
- Easy to use reports that allow quick remediation guidance.
- Fulfills PCI ASV Requirement 11.2
- Frequently updated with new vulnerability scans.
- Advanced user definable scope setting such as IP ranges, URI seed lists, URI white lists, URI black lists and virtual hosts.
- Scan crawler can be tuned for maximum links, request delays, and custom transfer timeouts.
- New settings allow for many types of authenticated scanning such as; HTML form, NTLM, & HTTP basic authentication.
- Highly accurate detection of remote file include, local file include, command injection, code injection, format string issues, cross-site request forgery, and CRLF injection.

### Key Benefits:

- Integrated with existing tools to provide unified reporting of both network and web vulnerabilities.
- Discovers vulnerabilities in custom web sites and applications not just publicly available web applications.
- No software to download or install.
- High speed scanning with average scan times under one hour.
- All scan data is securely stored locally on the appliance without leaving the organizations network.
